

# EU Territorial Scenarios

**By Lewis Dijkstra, PhD**  
**Deputy Head of the Economic Analysis Unit,**  
**DG Regional and Urban Policy**  
**European Commission**

# Why is the Commission setting up territorial scenarios?

- *Create a central baseline scenario for EC territorial impact assessments*
- *Inform the discussion on the future of cohesion policy and the lagging regions project*
- *Stimulate a debate on the possible and desirable future spatial distribution of population, employment and economic activities*

# What is the Commission doing?

- **REGIO and JRC** are setting up a limited set of economic and demographic regional projections linked to national projections by [ECFIN](#) and regional projections [Eurostat](#) (EUROPOP2013).
- The economic regionalisation is based on a sectoral trend extrapolation
- The demographic regionalisation is done by Eurostat using regional demographic indicators
- A further disaggregation to LAU-2 and grid level

# Regionalisation - disaggregation

Spatial level	Number of units
Member States	28
NUTS-2 regions	272
NUTS-3 regions	1300
LAU-2	+/- 130 000
Grid cells	> 4 000 000

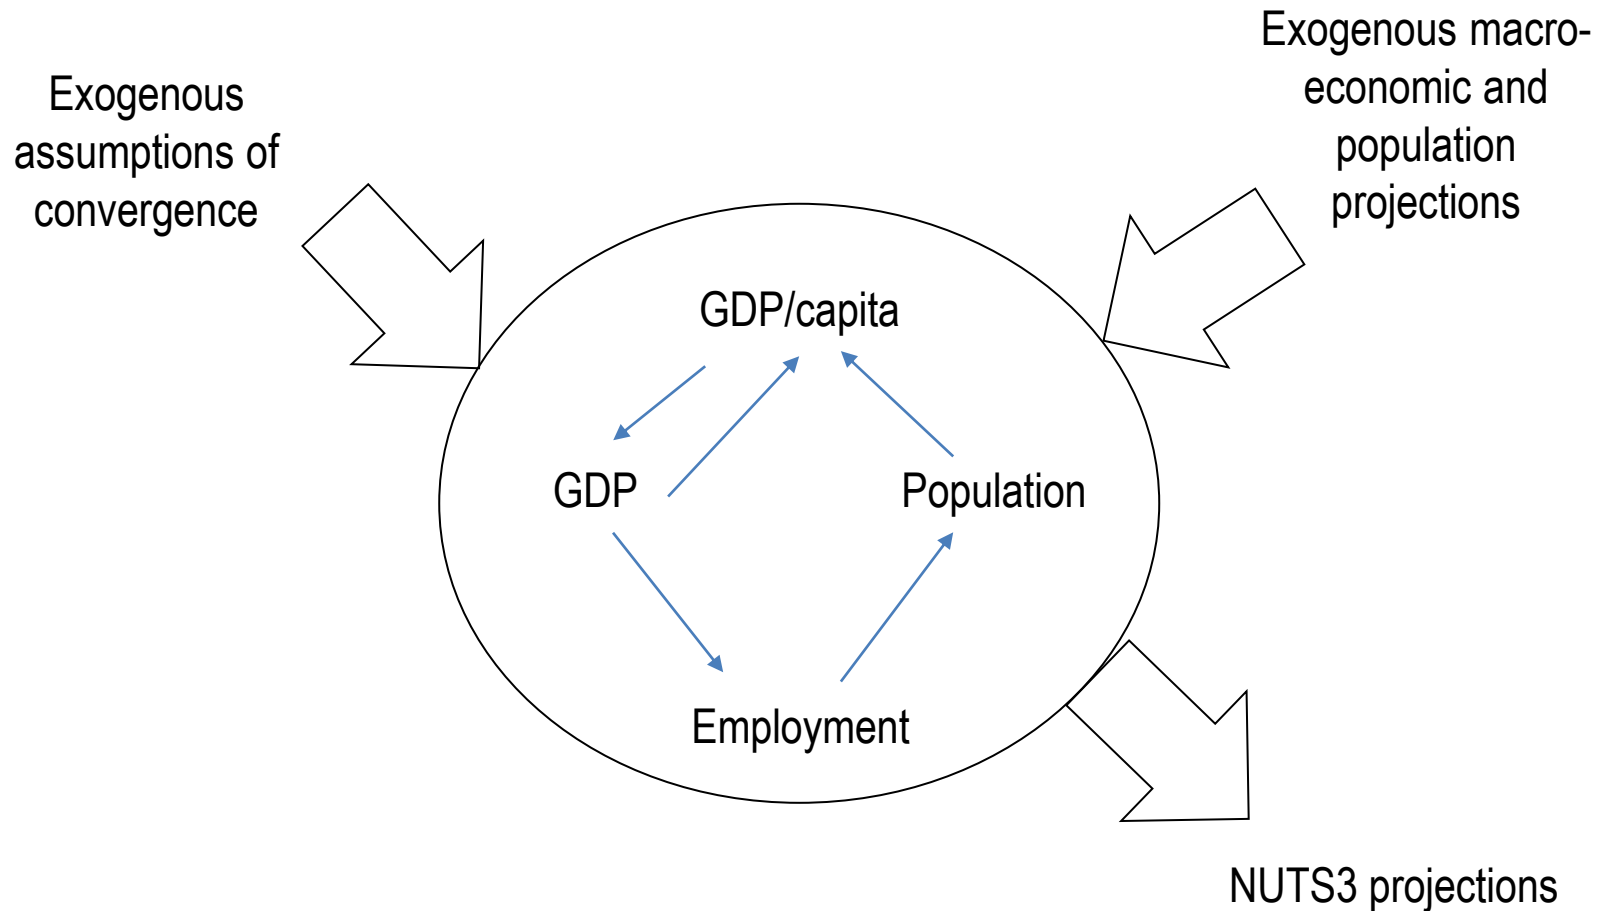

# NUTS-3 vs LAU-2 & grid

- *Regional trends at NUTS-3 relatively well understood (economic & demographic)*
- *Trends at the LAU-2 level and grid level require more analysis to identify key determinants*
  - **Time series of population at the LAU-2 level**
  - **Population grid based on LandSat GHSL for 1990, 2000 and 2014**
  - **Econometric analysis**

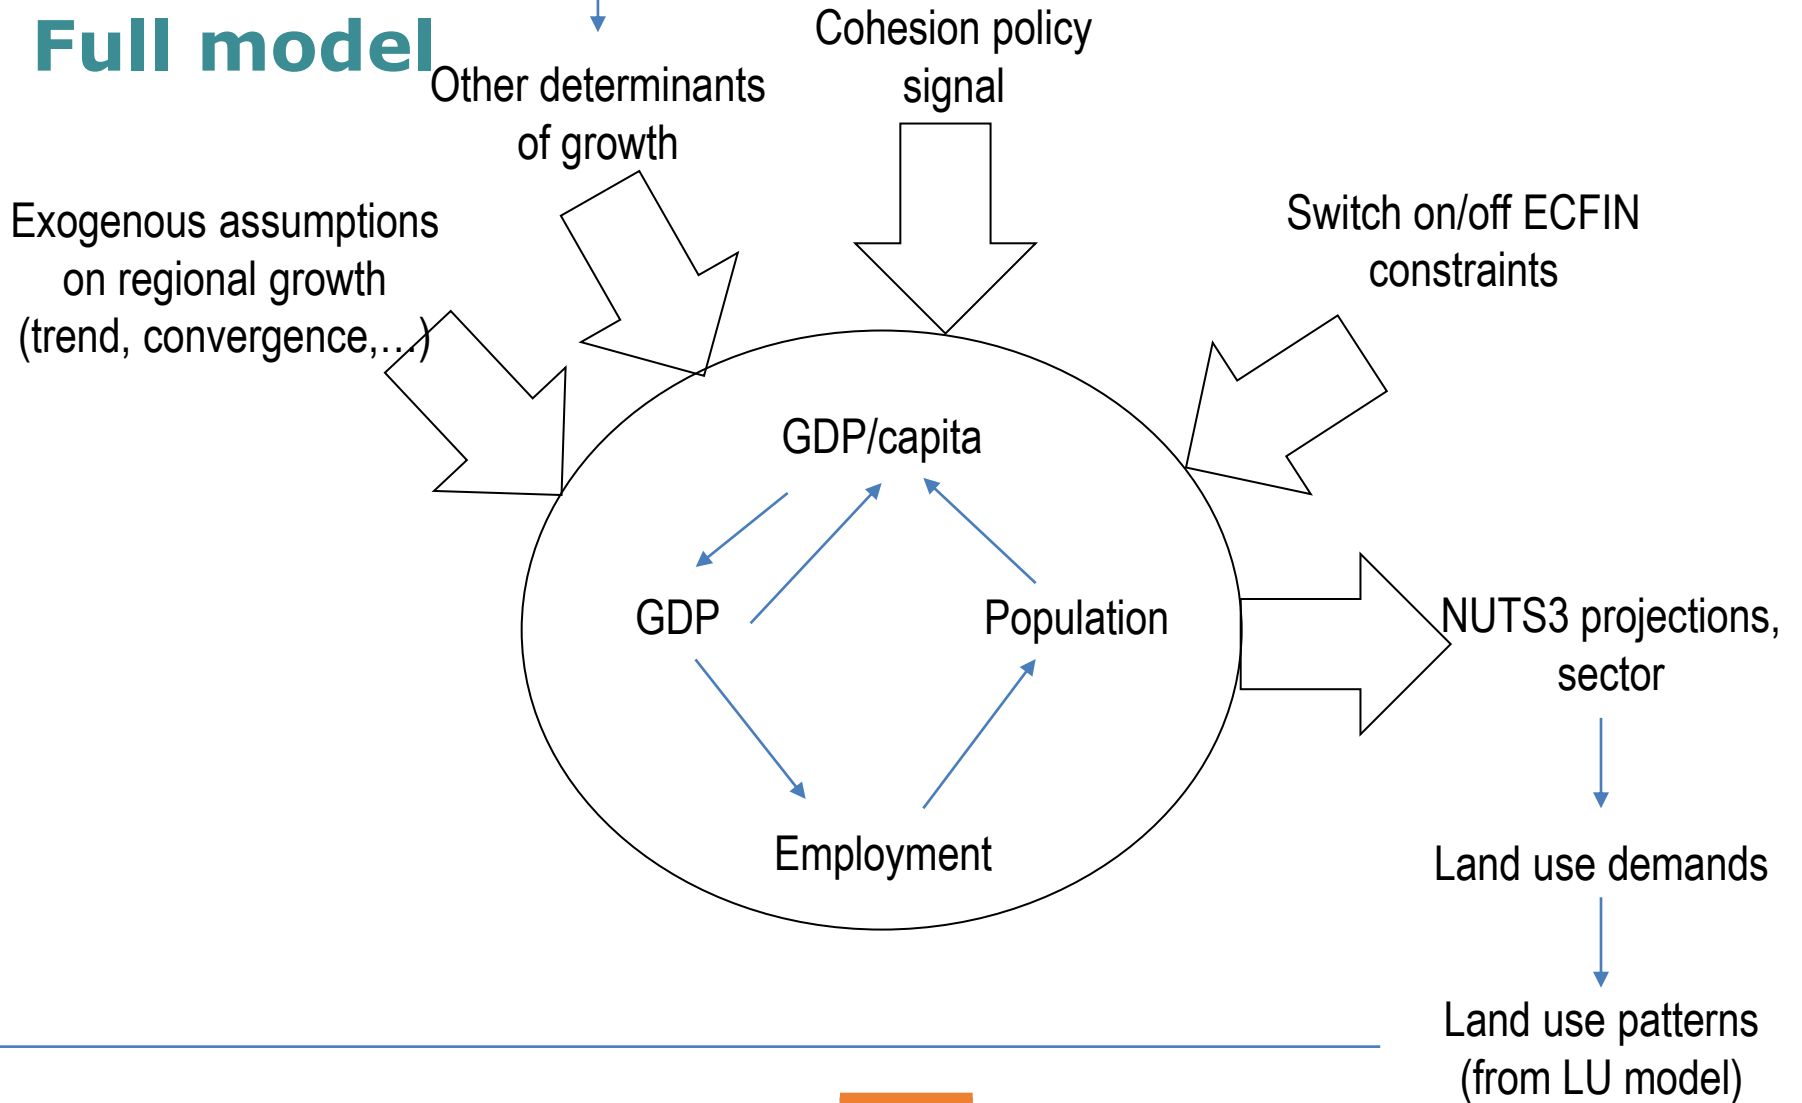

# Scenarios

- *A central baseline scenario which corresponds to Eurostat regional population projection*
- *A convergence scenario, where productivity grows faster in low productive regions*
  - **But what about migration?**
- *Other spatial scenarios (to be developed)*
  - **Compact development vs business as usual**
  - **Large city population growth vs more dispersed growth**

# Prototype convergence model

# Full model

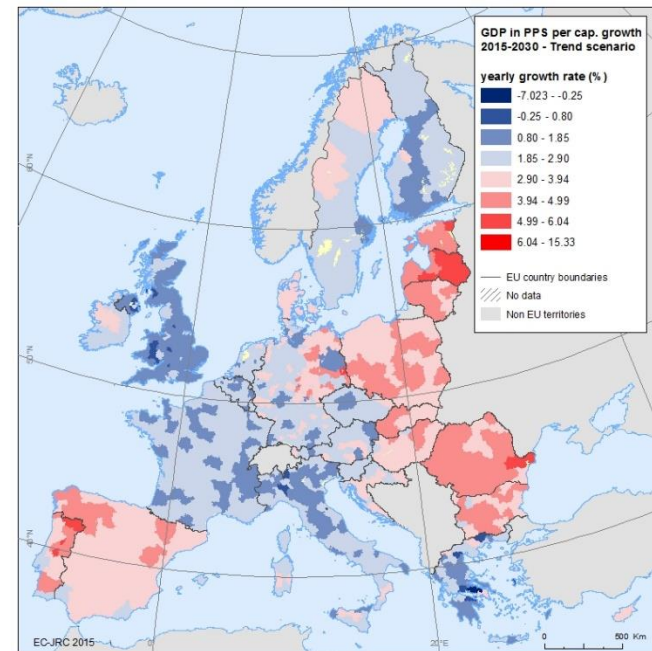

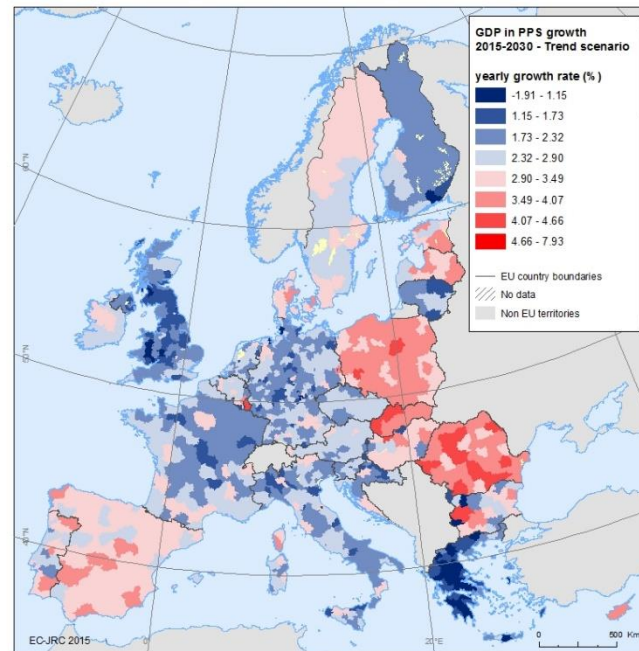

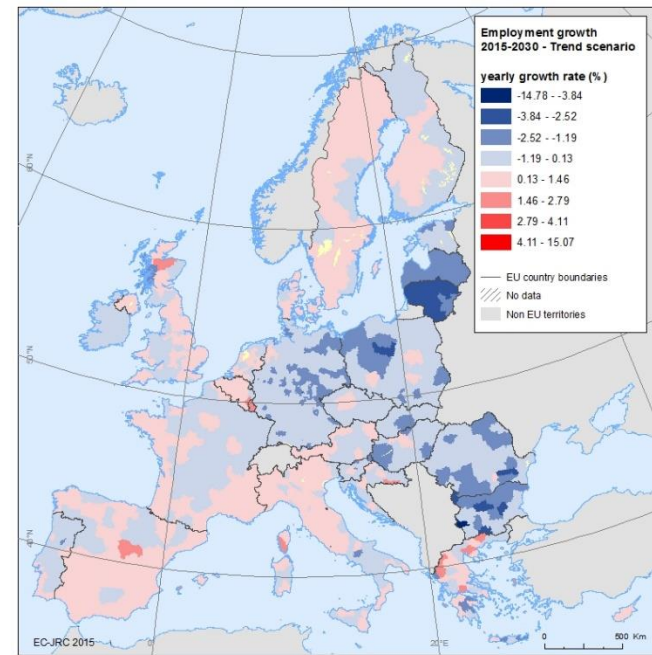

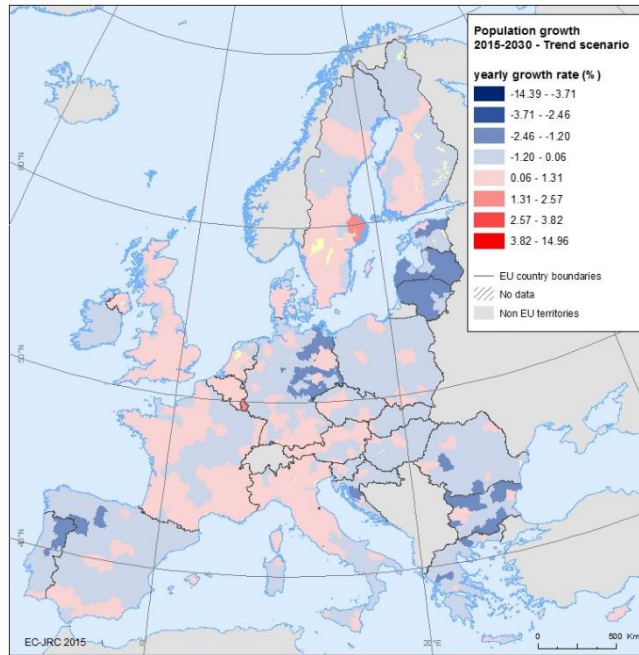

# What will be projected until 2050?

- *Population by age and sex*
- *Migration*
- *GDP*
- *Employment*
- *Land use*
- *Accessibility*

## ***Spatial levels***

- *NUTS-2 and 3*
- *Local (LAU-2)*
- *1 km grid*
- *100m grid*

# Trend Scenario

European  
Commission

## Trend scenario

**Type 1 = > 90% average EU GDP/cap in 2010**

**Type 2 = 75%:90% idem**

**Type 3 = < 75% idem**

# Timing

- *The draft trend scenario is ready*
- *Eurostat NUTS-3 population projections to be integrated (coming weeks)*
- *Convergence scenario ready by November*
- *NUTS-3 working paper by end 2015*
- *Disaggregation to the LAU-2 and grid ready by early 2016*

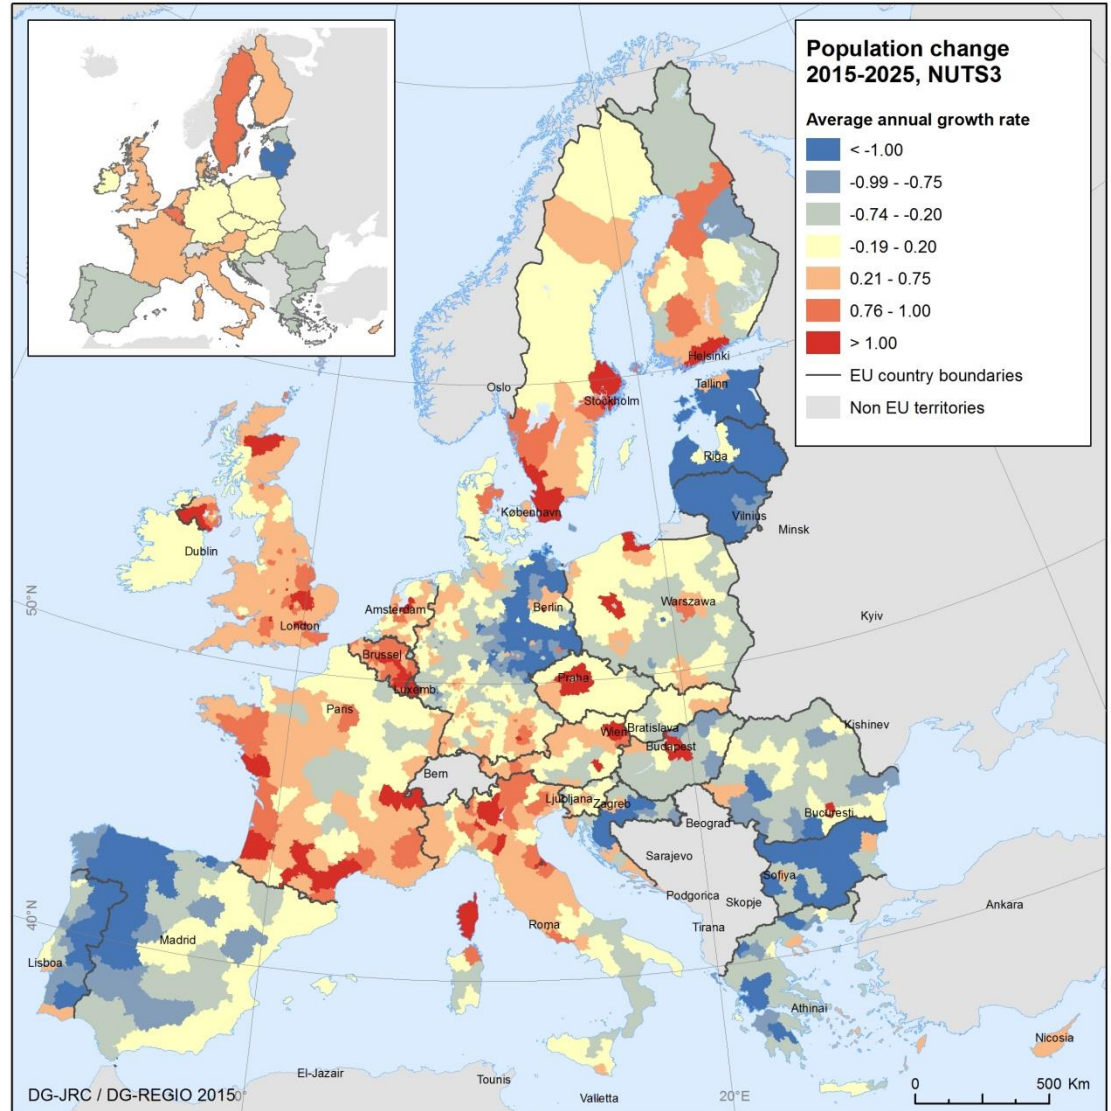

# Population

# Population

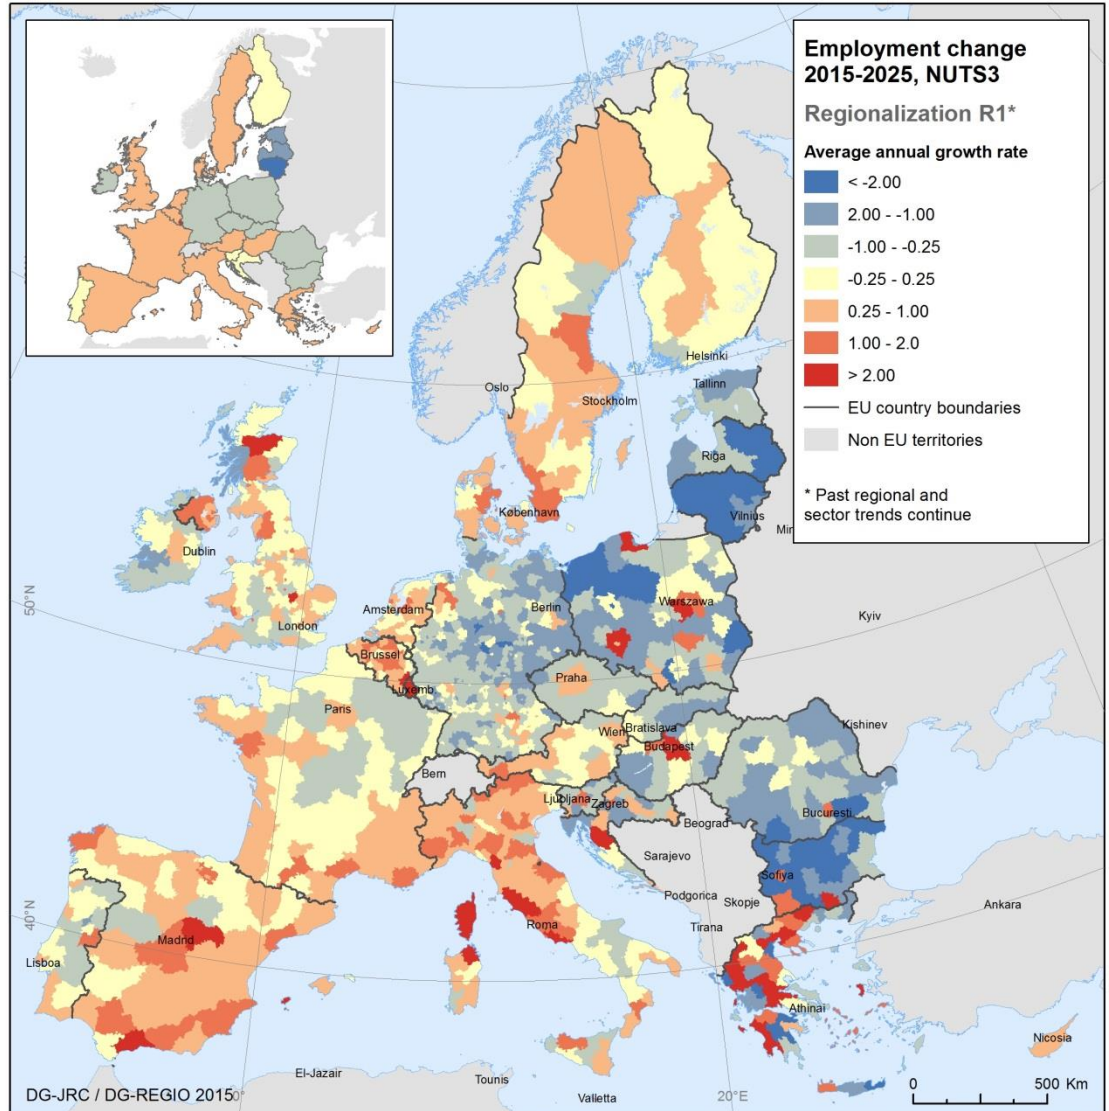

# Employment

# Employment

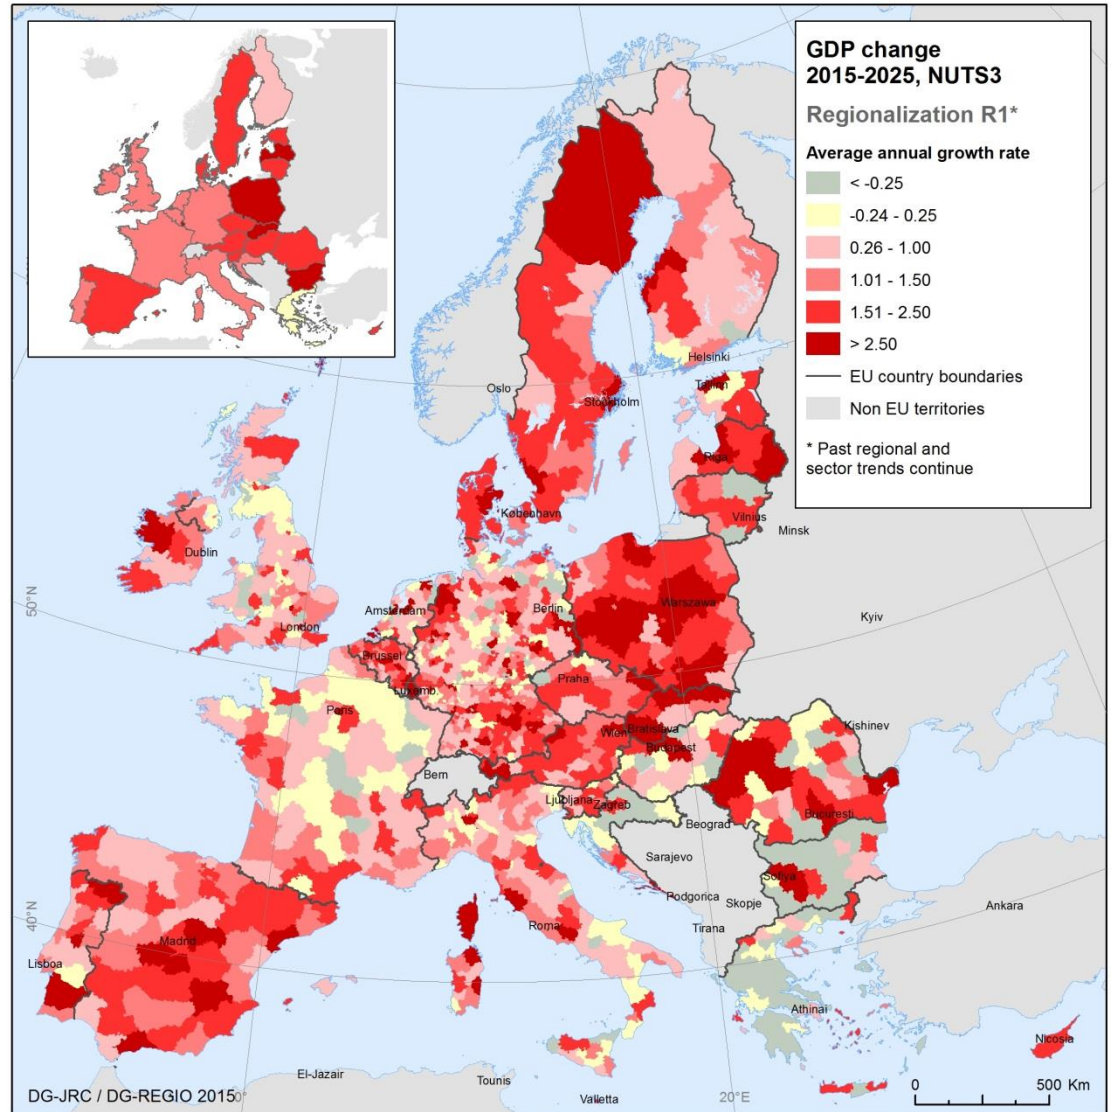

# GDP growth

# Grid population projection

- *Allows an analysis of urbanisation over time*
- *This will be based on local population projections AND changes in degree of urbanisation (cities appearing/disappearing)*
- *Can support cost benefit analysis of transport infrastructure investment*

# Conclusions

- *Challenging work requiring more data, new methods and new sources*
- *Can contribute to many important discussions within the Commission, between the MS and globally*
- *Will be disseminated freely as a public good*
- *Will be maintained, updated and improved over time*
